

PBA Downloader

svn URL: `svn+ssh://pba@svn.clazzes.org/svn/pba/trunk/pba-download`

Package name: `python3-pba-download`

Description

The PBA downloader fetches one or more packages from a list of yum or deb repositories without using any data persisted on the host system.

It may be fed with a config file describing a large number of packages to be downloaded to one or more subdirectories of the current directory.

DEB repositories

All-in-one cmdline

This variant allows to download multiple packages using one or more repositories specified by the `-r <depline>` option. The debian repository line must not contain components, which are taken from the release file of the repository if not explicitly specified.

An architecture must be specified using the option `-a <arch>`.

Download debian packages by specifying the repository on the cmdline.

```
$ pba-download -r 'deb http://ftp.at.debian.org/debian stretch' -a amd64 libc6 libc6-dev

Download using a config file

You may create a config file, which contains multiple package names and multiple repository lines.

deb-packages.conf config file for large-scale debian download

```
[deb]
osgi-runner-2=deb https://deb.clazzes.org/any any-osgi-runner-2
osgi-3=deb https://deb.itcg.at/any any-osgi-3
myapp-2=deb http://deb.mycompany.com/any any-myapp-2
[options]
arch=amd64
[osgi-main-packages]
osgi-runner-server
osgi-runner-client
osgi-runner-osgi-bundle-activator
osgi-runner-oracle12
osgi-runner-log4j2
osgi-runner-systemd
osgi-bundles-common
osgi-bundles-jdbc
osgi-bundles-remoting
osgi-bundles-pdfbox
osgi-bundles-dojo
osgi-bundles-dmutils
osgi-bundles-login-adapter
osgi-bundles-login-services
osgi-bundles-fancymail-server
[myapp-main-packages]
myapp-bundles
```

The packages are downloaded to two subdirectories, `osgi-main` and `myapp-main`, respectively.

Start a config file driven download

```
pba-download -c deb-packages.conf
```

YUM repositories

All-in-one cmdline

This variant allows to download multiple packages using one or more repositories specified by the `-y <repourl>` option.

An architecture and a distro must be specified using the option `-a <arch>` and `-d <distro>`.

Download RPM package from a YUM repository on the cmdline.

```
$ pba-download -y http://rpm.clazzes.org/repos/fancyclibs-1/fancyclibs-1.repo -a x86_64 -d 7 fancylog-1
fancylog-1-devel
