

Test tool for investigating how java sees a system's environment

Sometimes Java programs operate unexpectedly regarding timezone, file encoding and the like.

I have written a small test program that investigates the things I consider crucial for system dependent behaviour.

To execute [SystemInvestigator.java](#), do something like this:

```
wget https://confluence.clazzes.org/download/attachments/2293870/SystemInvestigator.java  
  
javac SystemInvestigator.java  
java SystemInvestigator |tee SystemInvestigator.log
```
