

org.clazzes.login.sql

Introduction

The `sql-login-service` is provided as an OSGi bundle, which may be activated by

```
obr:addurl http://maven.clazzes.org/repository.xml  
obr:deploy sql-login-service
```

The maven artifact is:

```
<groupId>org.clazzes.login</groupId>  
<artifactId>sql-login-service</artifactId>
```

Functionality

The SQL login service authenticates against users in a SQL database, using configurable SQL queries.

There are no plans to support authentication domains, because typical standalone login systems do not care for domains.

Configuration

With version 1.2 we introduced a new feature (support for multiple authentication domains covered by distinct databases) and switched to [JDBC-Provider](#) as DataSource pool.

Therefore the configuration depends on the version of `sql-login-service` used:

- [Configuring org.clazzes.login.sql 1.0 to 1.1](#)
- [Configuring org.clazzes.login.sql 1.2+](#)
