

Mail.Log-Parser Home

MLP (Mail.Log-Parsing) is a script and soon-to-be script collection to make it easier to extract useful information from `/var/log/mail.log` as produced by postfix setups like our Mailhaus.at.

Tracing emails with only `grep` is difficult because the major properties of a single mail, like sender, recipient, and message-id, usually are distributed over multiple lines.

`mlp-findmails` makes this task a one-liner. and extended it quite a lot.

Some core parsing lines are based on http://www.perlmonks.org/bare/?node_id=444335 but I have built lots of new functions and options around them.

`mlp-findlogins` allows helps to i.e. trace typos of user who "can not get my mail and have not make a typo".

All commands understand `--version` and `--help`.

Download

mlp is of course available via our [debian repository deb.clazzes.org](http://deb.clazzes.org).
