

PBA Package Builder + Archiver Home

Introduction

PBA is the collection of tools that builds and distributes all our C++ software and Debian packages.

It consists of:

- pba-archiver manages debian archives like deb.clazzes.org, including the pba packages themselves
- pba-builder builds debian source packages for several debian like distributions using pbuilder, and optionally feeds the results to incoming directories of pba-archiver installations
- pba-devtools provides tools to prepare (build, install) packages to be built using pba-builder and/or distributed using pba-archiver
- pba-cbs is a set of Makefile snippets that allow projects to use short, simple and most importantly static Makefiles even for cross compilation to multiple targets
