

squid options for Intranets

Some of squid's default config params are not really satisfying.

Usually, you want to change the size of the cache to say 20 Gig ...
cache_dir ufs /var/spool/squid 20000 16 256
... and allow your complete LAN to access your squid:

```
# after acl localhost src 127.0.0.1/255.255.255.255  
acl lan 10.0.13.0/255.255.255.255  
# and after http_access allow localhost  
http_access allow lan
```

or simply change ...
http_access allow localhost
... to ...
http_access allow all
... and leave the rest to iptables + /etc/hosts.deny + /etc/hosts.allow
