

# Clazzes.org's new SSL certificate not recognized by squeeze's ca-certificates package

Why, Debian, why?

Last weekend I updated the SSL certificate used for all VirtualHosts on Clazzes.org, like this very site, and <https://deb.clazzes.org> and some others.

Unfortunately, Debian's [ca-certificates package](#) is not maintained for old-stable. For more details, see [debian bug 501123](#).

Therefore, Tools like `apt-get`, `wget` and `curl` refuse to download GPG keys, packages, or other stuff from Clazzes.org with https, unless special options like `wget's --no-check-certificate` are used.

We are already thinking about providing updated `ca-certificates` packages for old-stable versions like `squeeze` and [I just entered the bug discussion](#).
